

WHAT IS CLAIMED IS:

1. A walking support for a leg, the support comprising:
 - a) a boot portion;
 - b) a subfloor portion;
 - c) a pair of elongate tubular members affixed to, and extending upwards from, the subfloor portion;
 - d) the boot portion slidably mounted on the exterior of the tubular members for free vertical translatory motion thereon;
 - e) a spring element freely movable within each tubular member; and
 - f) a pair of elongate elements, each element having a first end provided with means for mounting on a leg below the knee, and a second end constructed for being slidably received within the tubular member atop the spring element.
2. The walking support according to claim 1 in which the spring elements are gas springs.
3. The walking support according to claim 1 in which the spring elements are elastomeric springs.
4. The walking support according to claim 1 in which the spring elements are coil springs.
5. The walking support according to claim 1 constructed so that the elongate elements may be removed from the remainder of the apparatus by unfastening the boot from the foot and lifting them from the tubular members, and the support may be reassembled without adjustment by inserting the foot in the boot and the elongate elements in the tubular members.
6. The walking support according to claim 1 further comprising a resilient structure interposed between the boot portion and the subfloor portion.
7. A walking support for a leg, the support comprising:
 - a) a boot portion;
 - b) a subfloor portion having a resilient arcuate bottom surface;
 - c) a pair of elongate tubular members affixed to, and extending upwards from, the subfloor portion;
 - d) the boot portion slidably mounted on the exterior of the tubular members for free vertical translatory motion thereon;

- e) a gas spring element freely movable within each tubular member; and
 - f) a pair of elongate elements, each element having a first end provided with means for mounting on a leg below the knee, and a second end constructed for being slidably received within the tubular member atop the gas spring element.
8. The walking support according to claim 7 constructed so that the elongate elements may be removed from the remainder of the apparatus by unfastening the boot from the foot and lifting them from the tubular members, and the support may be reassembled without adjustment by inserting the foot in the boot and the elongate elements in the tubular members.
 9. The walking support according to claim 8 further comprising a resilient structure interposed between the boot portion and the subfloor portion.
 10. The walking support according to claim 7 further comprising a resilient structure interposed between the boot portion and the subfloor portion.
 11. A walking support for a leg, the support comprising:
 - a) a boot portion;
 - b) a subfloor portion;
 - c) a resilient structure interposed between the boot portion and the subfloor portion to keep the area therebetween free of foreign items;
 - d) a pair of elongate tubular members affixed to, and extending upwards from, the subfloor portion;
 - e) the boot portion slidably mounted on the exterior of the tubular members for free vertical translatory motion thereon;
 - f) a gas spring element freely movable within each tubular member;
 - g) a pair of elongate elements, each element having a first end provided with means for mounting on a leg below the knee, and a second end constructed for being slidably received within the tubular member atop the gas spring element so that the elongate elements may be removed from the remainder of the apparatus by unfastening the boot from the foot and lifting them from the tubular members, and the support may be reassembled without adjustment by inserting the foot in the boot and the elongate elements in the tubular members; and

- h) the gas springs being freely replaceable when the elongate elements are removed from the tubular members.
- 12. The support according to claim 11 in which the subfloor portion has a resilient arcuate bottom surface.
- 13. The support according to claim 11 further comprising adjustment means for orienting the tubular elements so that they are parallel to one another.
